Empirically Determined Velocity Distribution of DM!

This makes the bounds on dark matter in direct detection experiments weaker at masses of ~ 10 GeV!

**From
Simulations:**

Metal-Poor
Stars trace
the velocity
of Dark
Matter.

**From Gaia
DR1:**

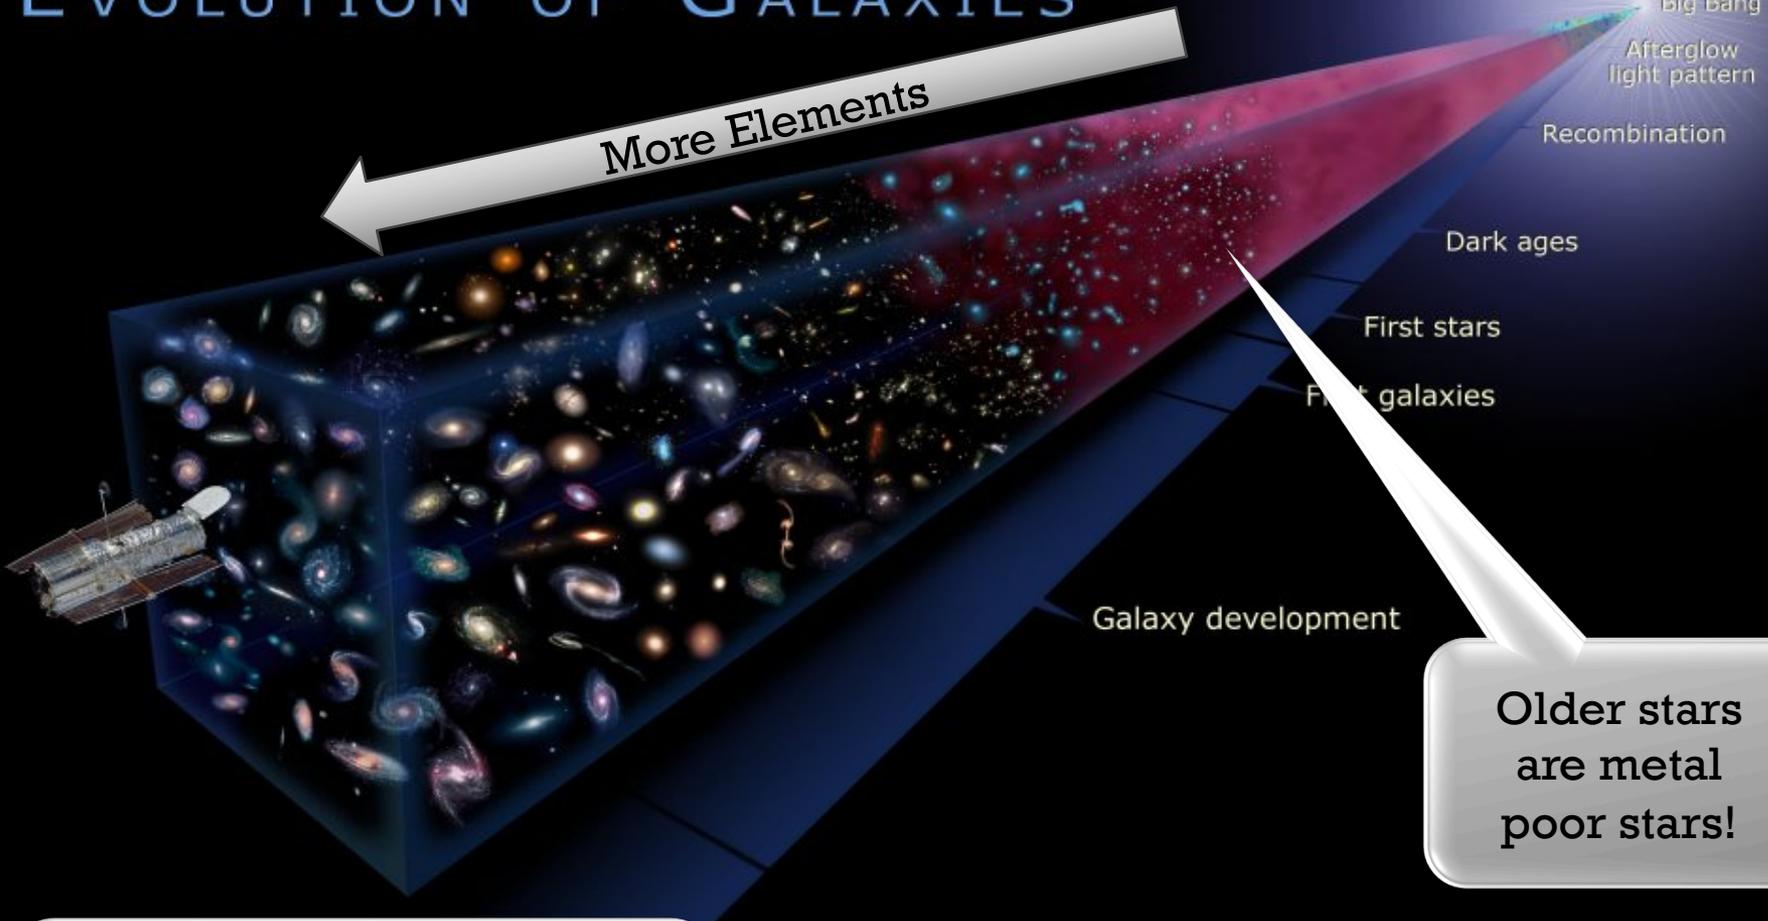

We get the
local
velocity
distribution
of Metal-
Poor Stars.

Therefore:

We
empirically
obtain the
Dark Matter
velocity
distribution.

EVOLUTION OF GALAXIES

More Elements

Older stars are metal poor stars!

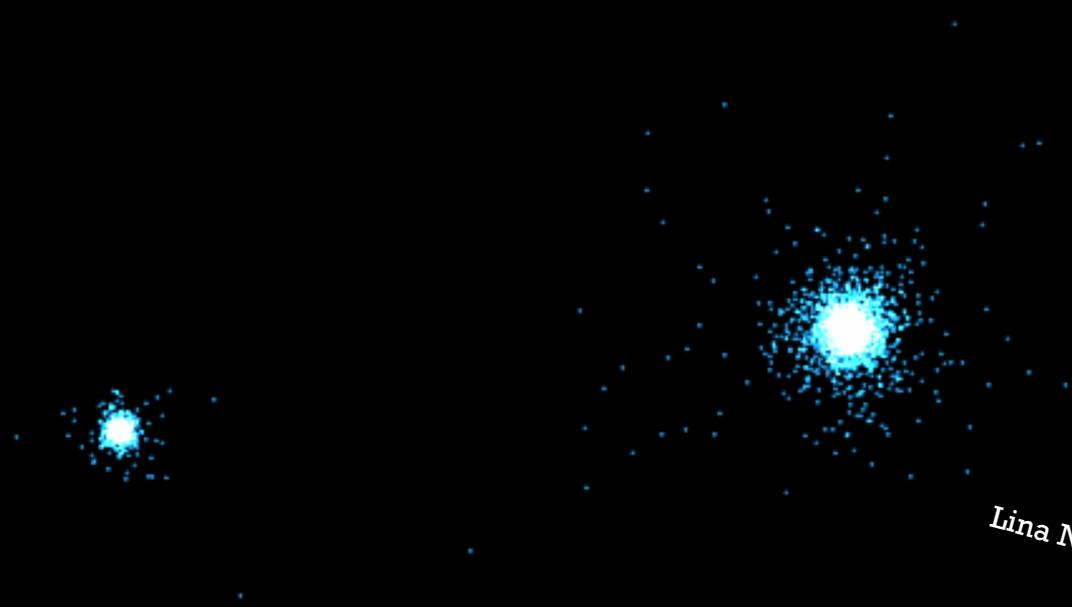

$$[\text{Fe}/\text{H}] = -1$$

Means that this star has 1/10 of the iron fraction of the Sun.

5

Direct Detection Rate

The DM velocity distribution is part of the computation of the expected direct detection rate.

$$\frac{dR}{dQ} \propto \frac{\sigma_0 \rho_0}{m_\chi m_r^2} F^2(Q) g(v_{\min})$$

Astrophysical Parameters:
Dark matter density, velocity.

Particle Physics Parameters:
Scattering cross section, mass of the dark matter.

Experimental Parameters:
Form factors, mass of the nucleus
(also experimental mass/
exposure should be added)

Direct Detection Rate

The DM velocity distribution is part of the computation of the expected direct detection rate.

$$\frac{dR}{dQ} \propto \frac{\sigma_0 \rho_0}{m_\chi m_r^2} F^2(Q) g(v_{\min})$$

$$g(v_{\min}) = \int_{v_{\min}}^{\infty} \frac{f(v)}{v} dv$$

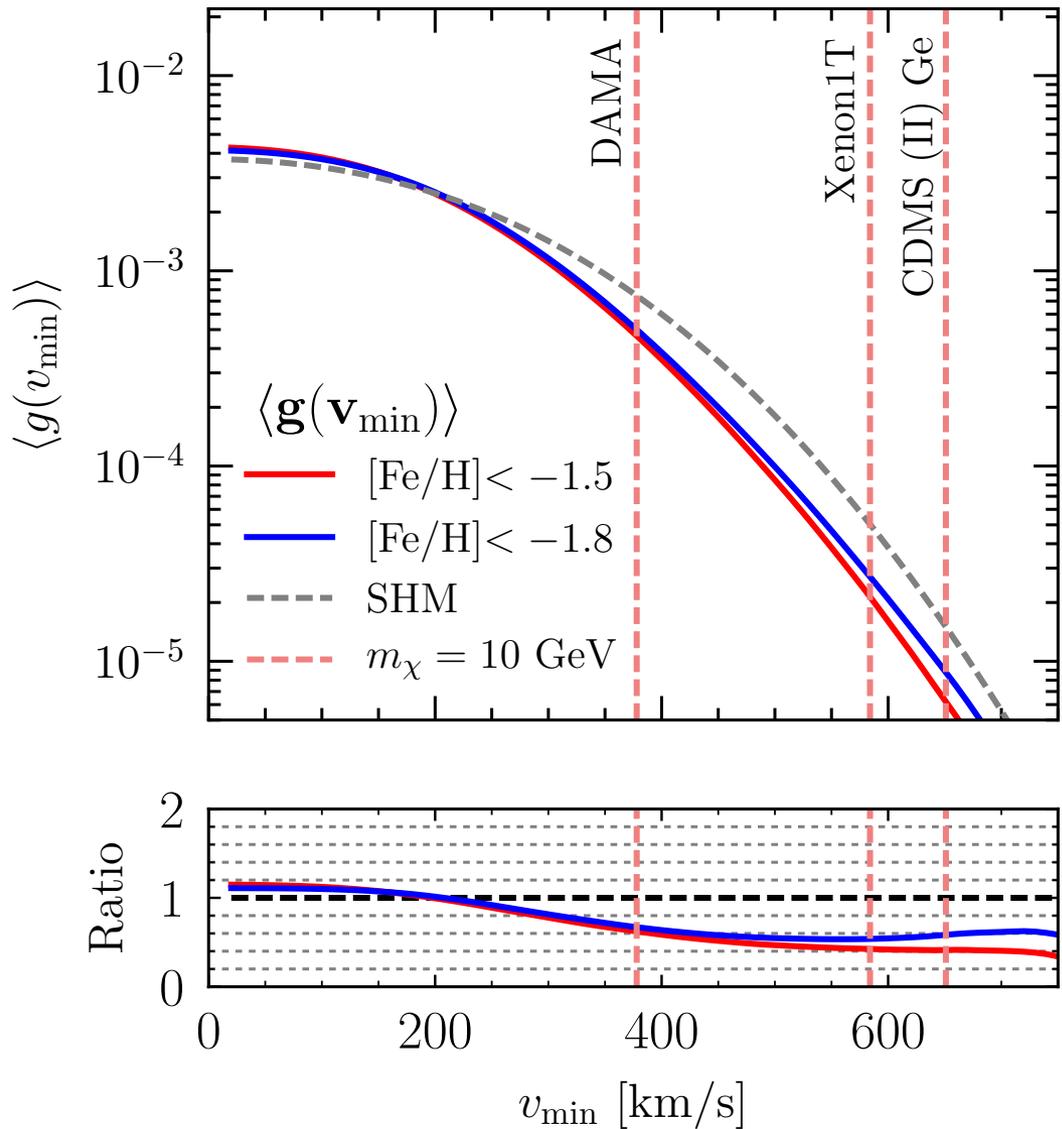

v_{\min} depends on the experimental threshold, and the dark matter mass.

In terms of Direct Detection Experiments

8/9/17

A hydrodynamic zoom in a simulation of the Milky Way galaxy. The image shows a dense, multi-colored (purple, blue, and red) spiral structure with a bright yellow-white core. The word "Eris" is written vertically in white text on the left side of the image.

Eris

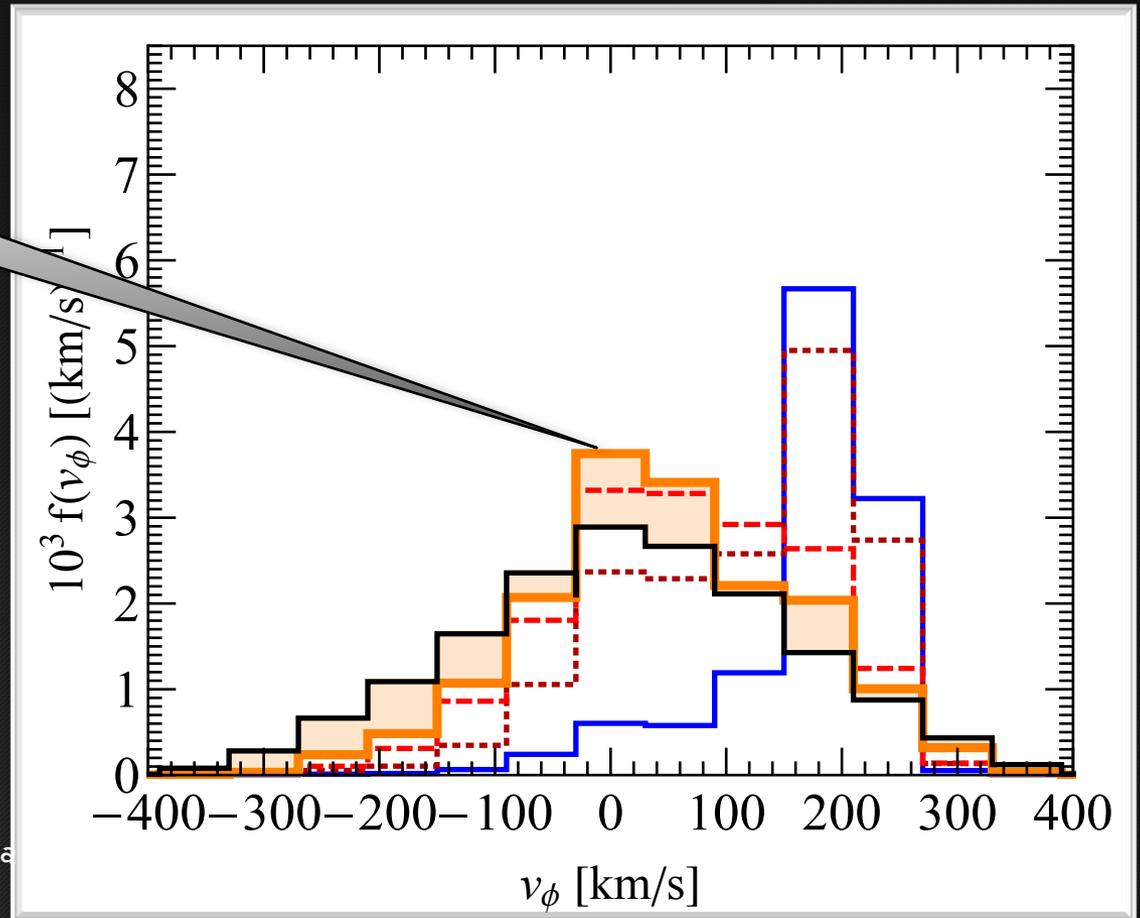

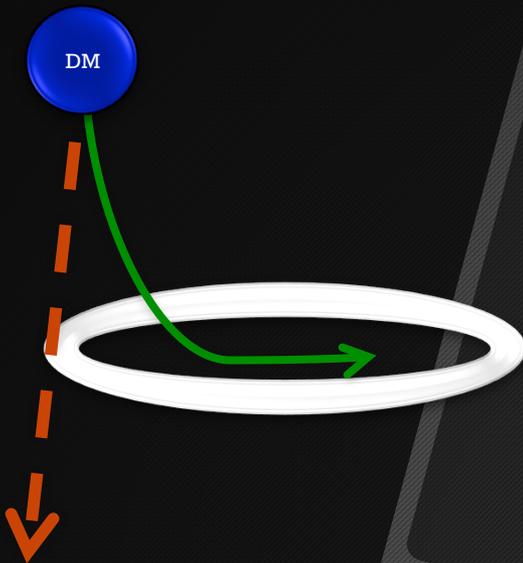

- Hydrodynamic zoom in simulation of the Milky way.
- Softening length 120pc.
- Evolution tracked from redshift 90 to present day, though we will focus on $z=0$.
- $7 \cdot 10^6$ DM particles
- $3 \cdot 10^6$ gas particles
- $8.6 \cdot 10^6$ star particles.
- $M_{\text{DM}} = 9.8 \cdot 10^4$ Solar mass
- $M_{\text{gas}} = 2 \cdot 10^4$ Solar mass
- Halo mass= $8 \cdot 10^{11}$ Solar mass.

Stellar and Dark Matter Distributions

Stellar and Dark Matter Distributions

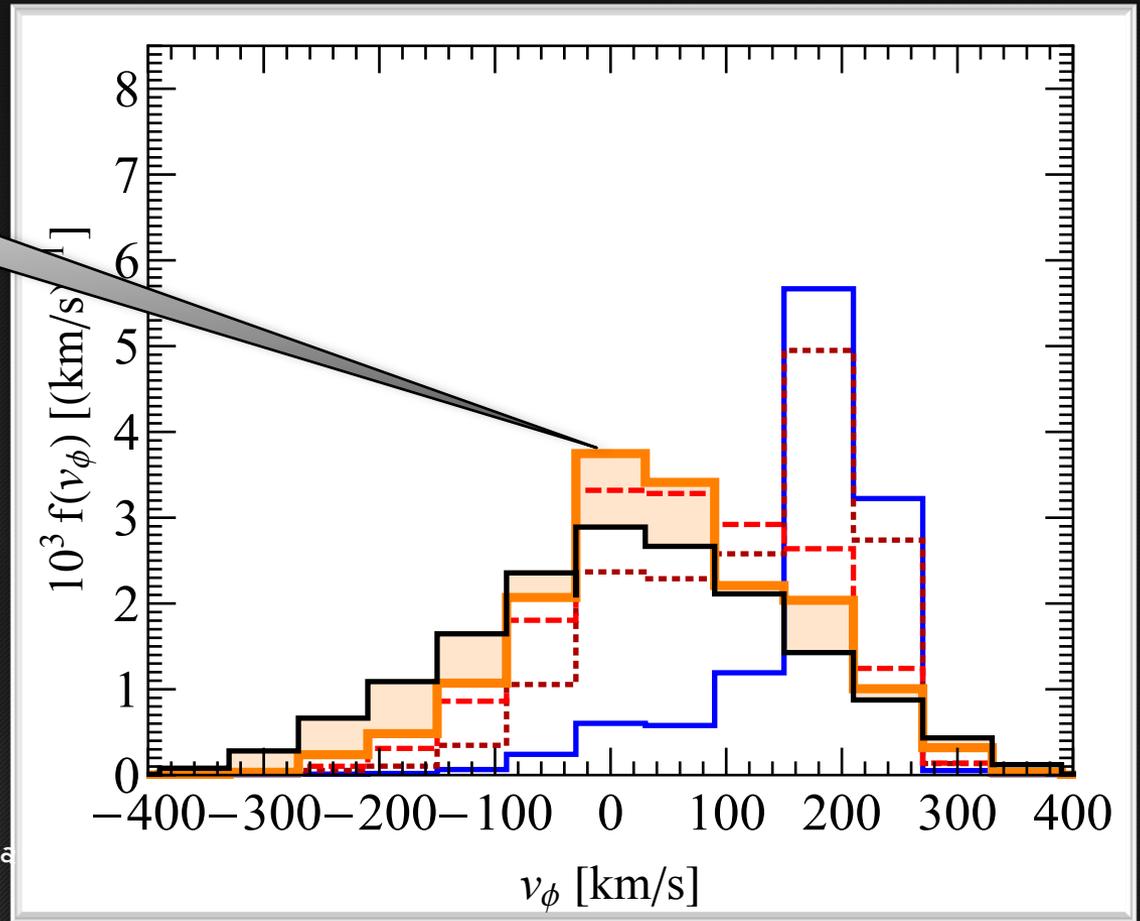

Prograde rotation
found in Eris

Stellar and Dark Matter Distributions

Prograde rotation found in Eris

There is no evidence for significant prograde rotation for metal poor stars in data.
