Motivation

What is the **major** parameter for blazars ?

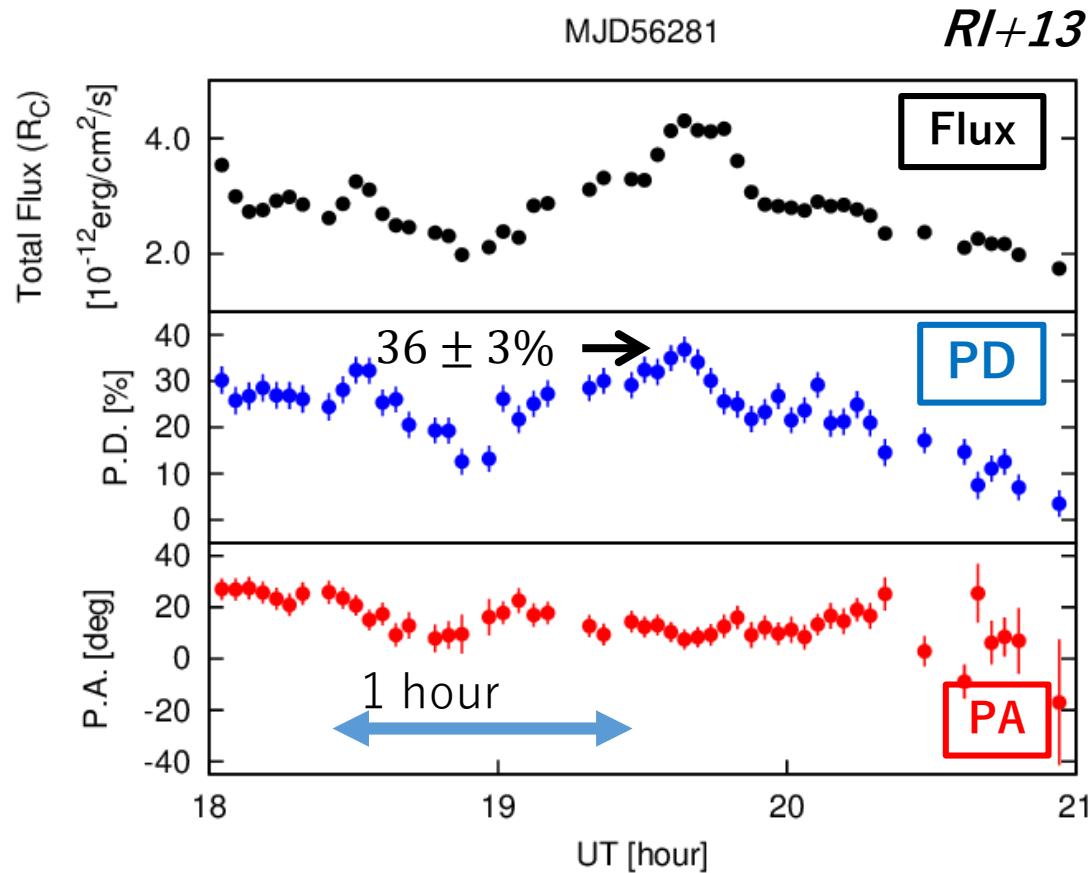

Blazar variability

Well correlated total flux & P.D. with constant P.A. is explained by
simple one-zone ‘shock-in-jet’ model

one-zone models also produce correlated synchrotron + gamma-ray variability (e.g., Mastichiadis & Kirk 1997)

e.g., PMN J0948+0022 flare in 2012

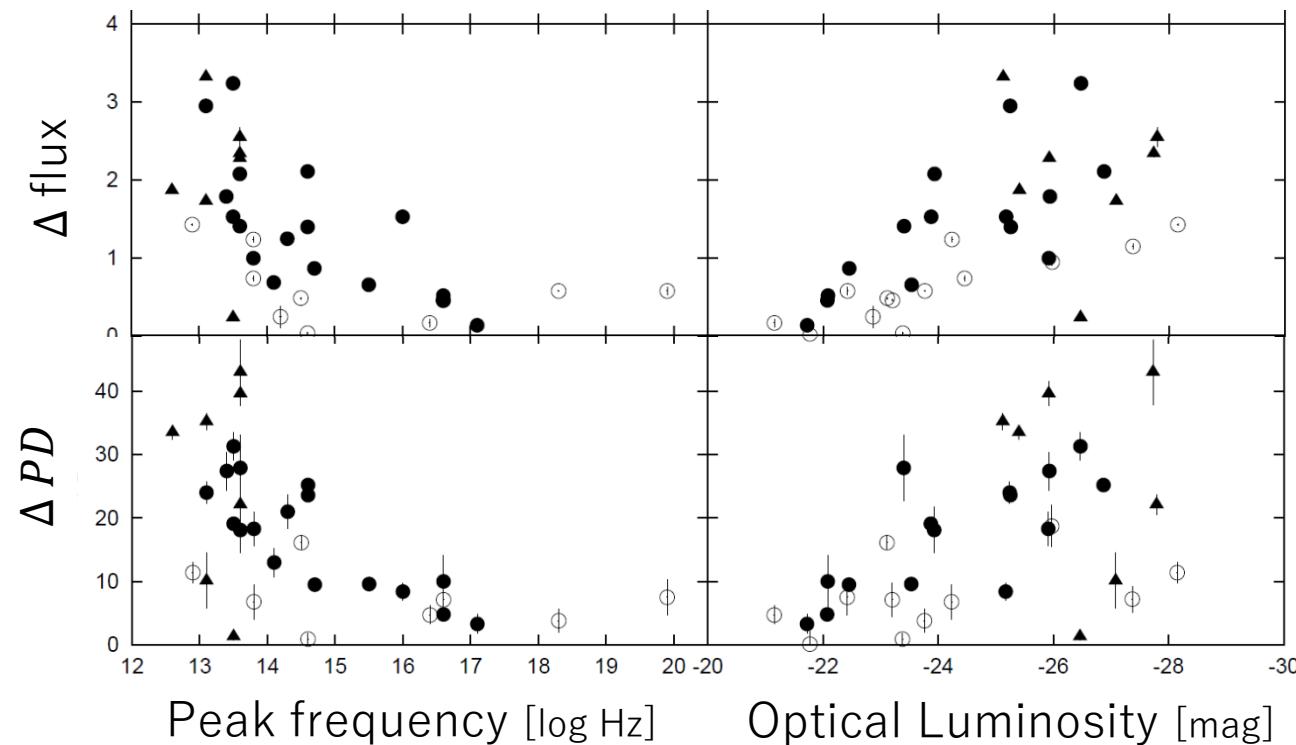

Systematic study for blazars

Ikejiri+11, modified

Variability of flux, color and polarization
Correlation between optical flux, polarization and gamma-ray flux

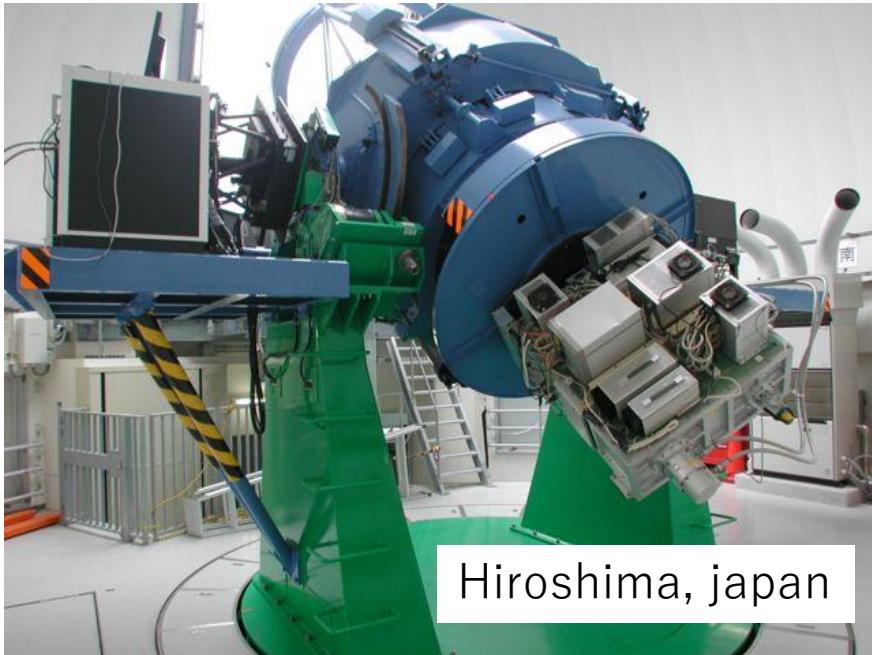

Varies by sources (or flares)

Observations

Kanata 1.5m telescope

Simultaneous Optical/NIR band obs.
Imaging polarimetry

Since Fermi launched (2008-), we performed

- Daily polarimetric monitor of ~40 AGNs
- Follow-up observation of GeV flare targets

Fermi/LAT

http://space.skyrocket.de/img_sat/glast_1.jpg

**100 MeV – 300 GeV
All sky survey
Pass 8 6.5 years data**

Target List

Red; GeV bright source

FSRQ	LSP	ISP	HSP	RL-NLSy1

QSO 0454-234 (28)			1ES 0323+022 (21)	
S5 1803+784 (35)	41 blazars, 6.5 year data All photopolarimetric data were public			
PKS 0754+100 (28)				
PKS 0215+015 (5)				
GB6 J1239+0443 (5)				

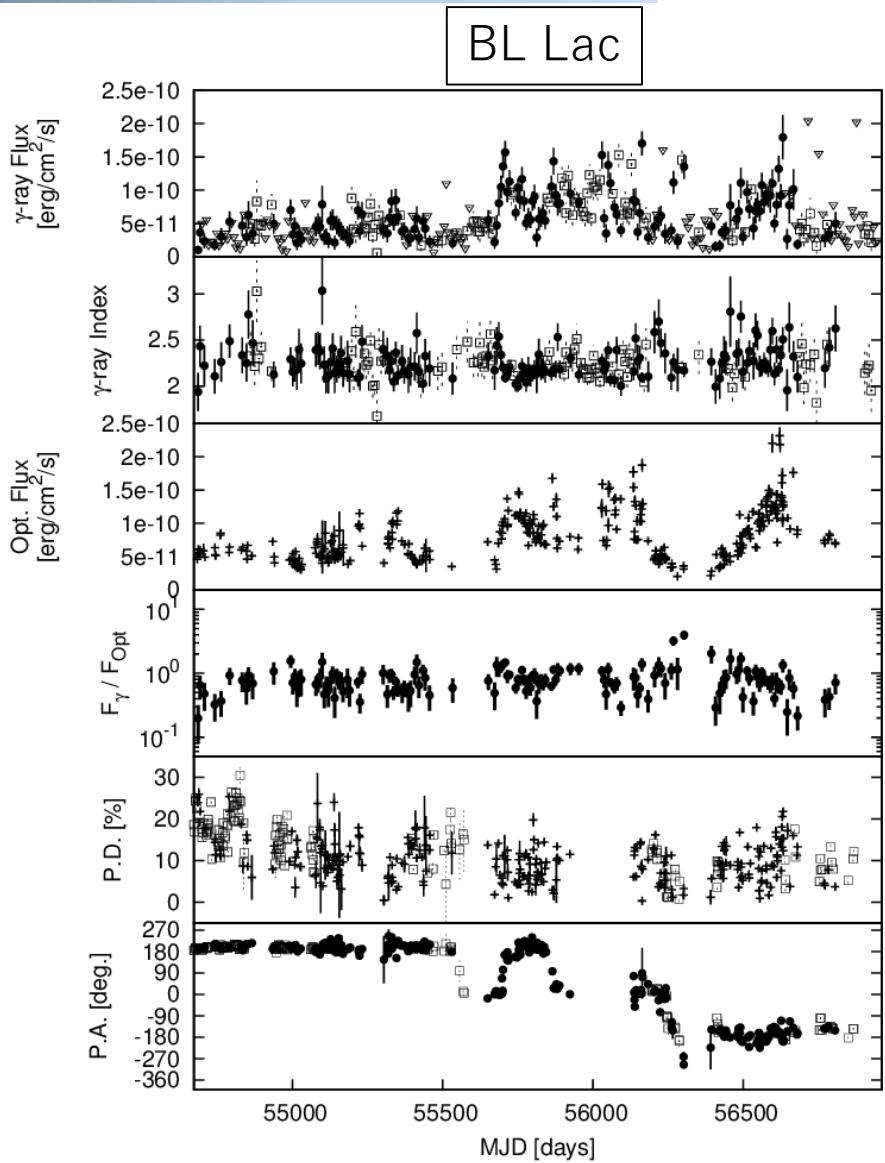

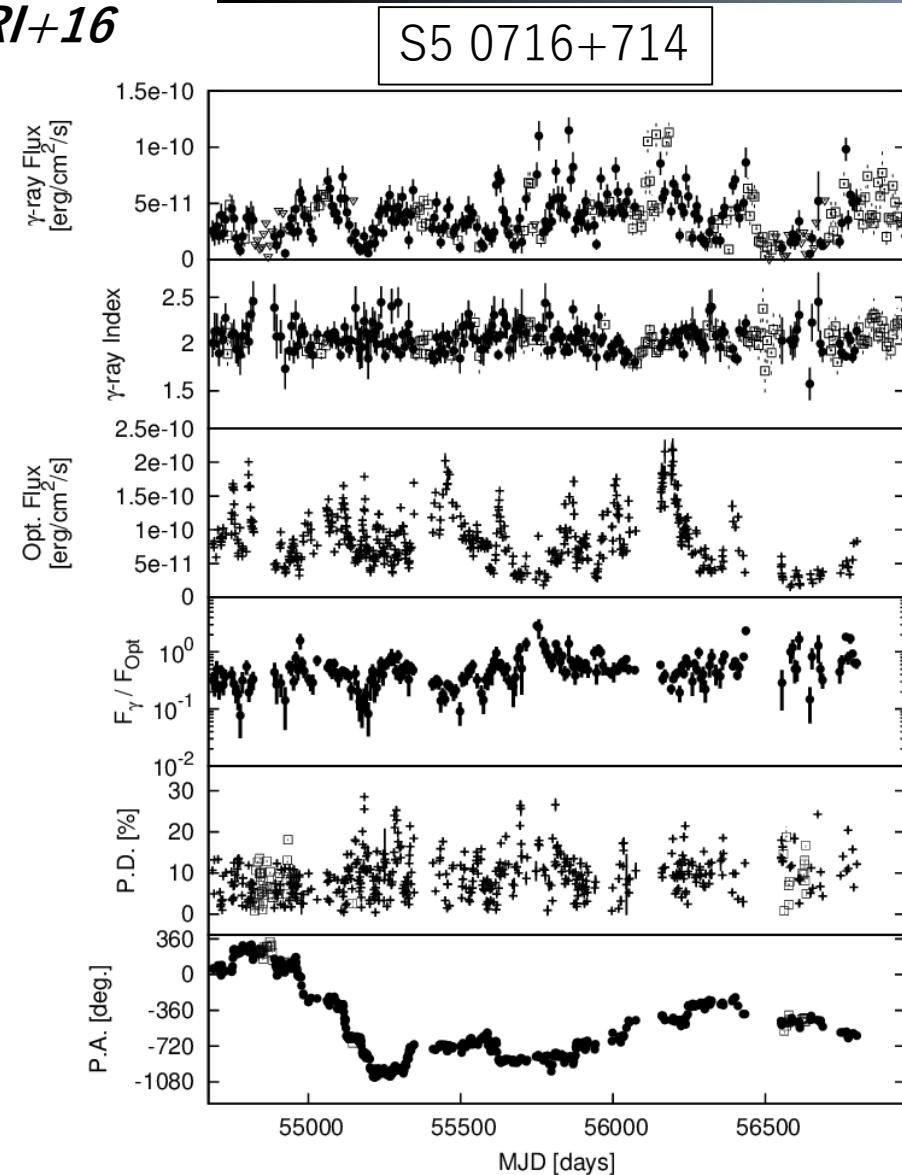

Vizier Kanata blazar

Light curves

RI+16

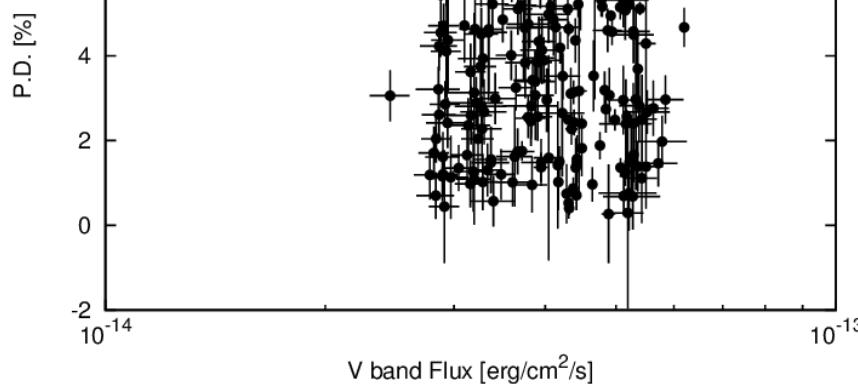

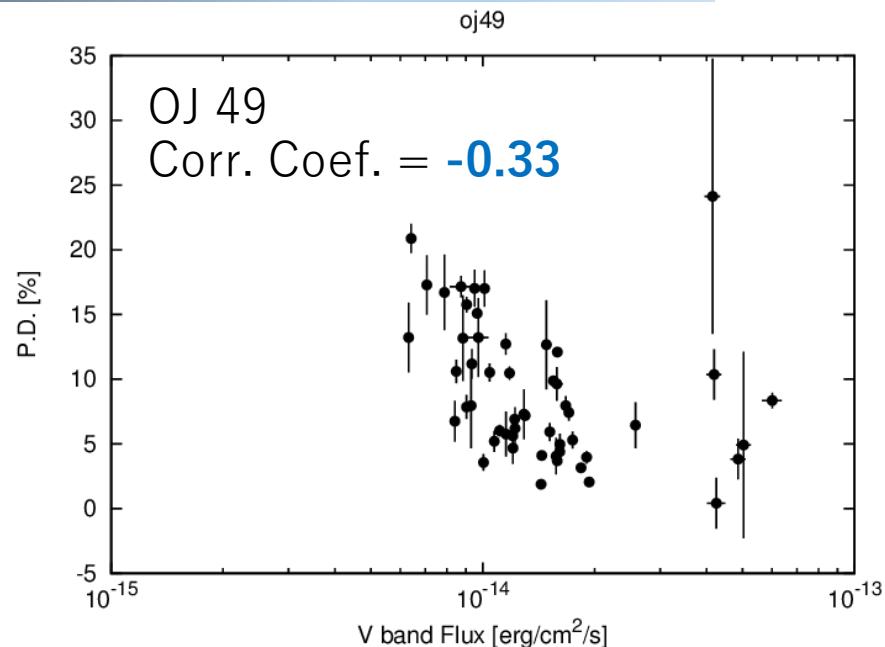

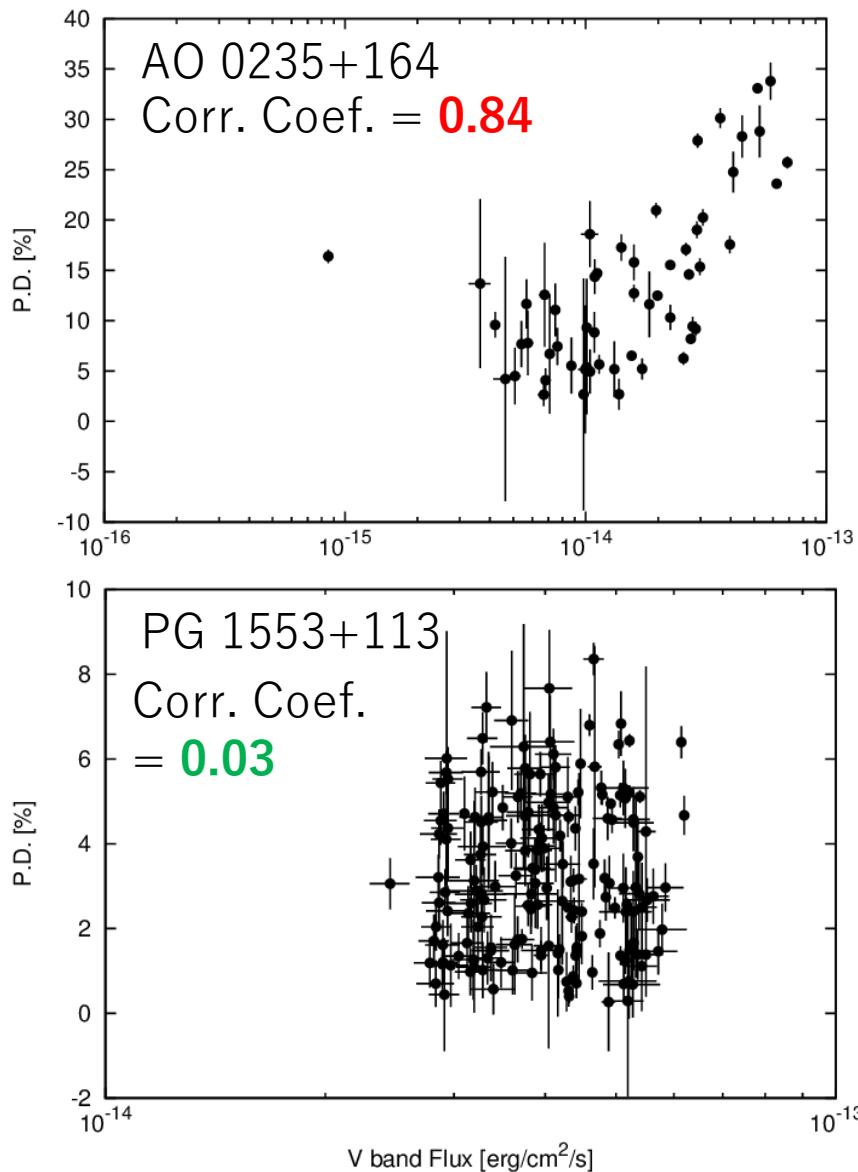

Correlation betw. flux and P.D.

ao0235

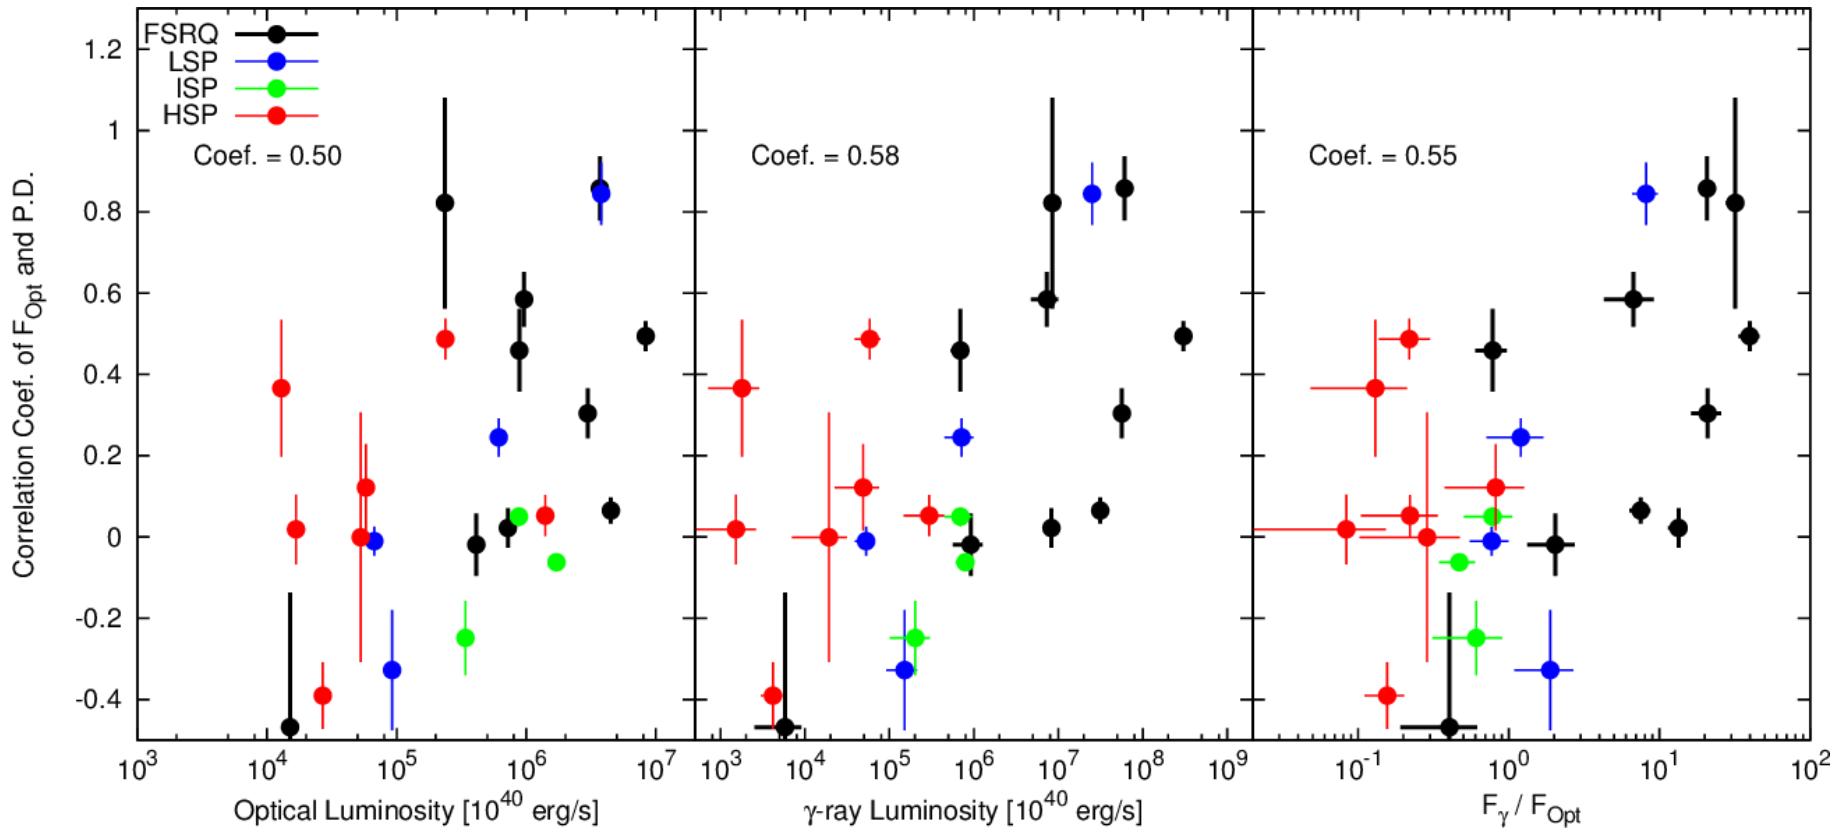

Even same type source does
not shows same trends
Chaotic!!

Correlation between Lum. & Correlation coef.

RI+16

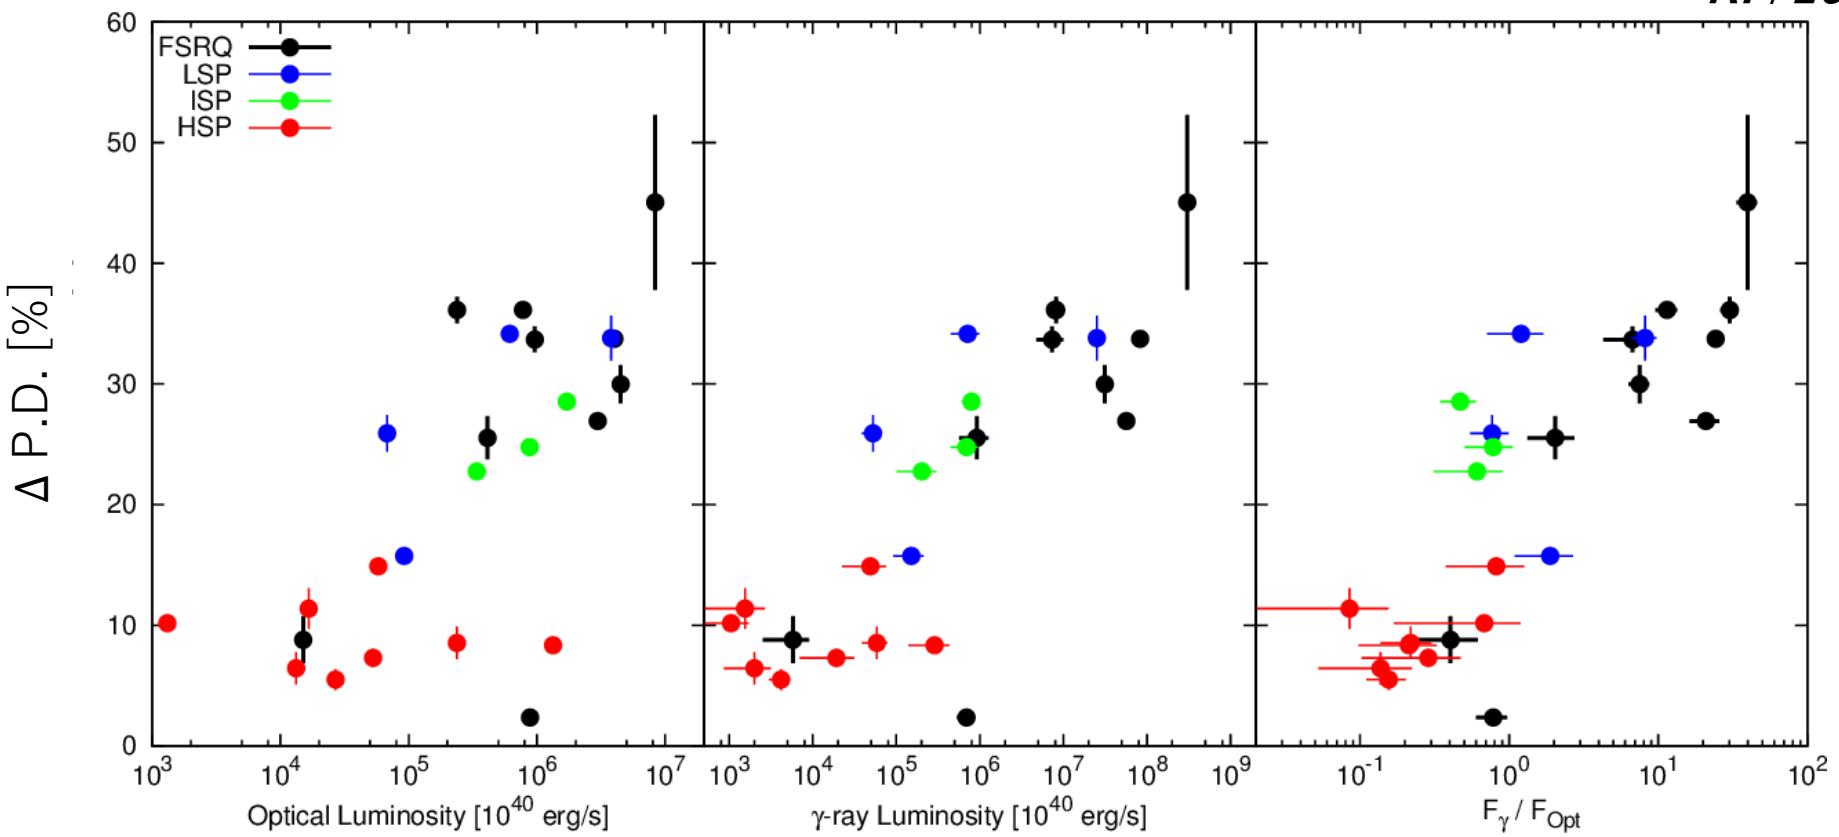

Gamma-ray luminous blazars tend to show correlation between optical flux and P.D.

Correlation between Lum. & Δ PD

RI+16

Variability of PD shows good correlation with gamma-ray Luminosity or ratio of gamma-ray flux and optical flux (not optical luminosity)

Discussion; Multi emission region

Compton Dominance (for external Compton)

$$\frac{L_{EC}}{L_{sync}} \sim \Gamma^2 \frac{u_{ext}}{u_B} \quad \text{Sikora+08}$$

	High PD	Low PD
Bulk Lorentz factor	High	Low
Number of emission region	Few	Many
Compton dominance	High	Low

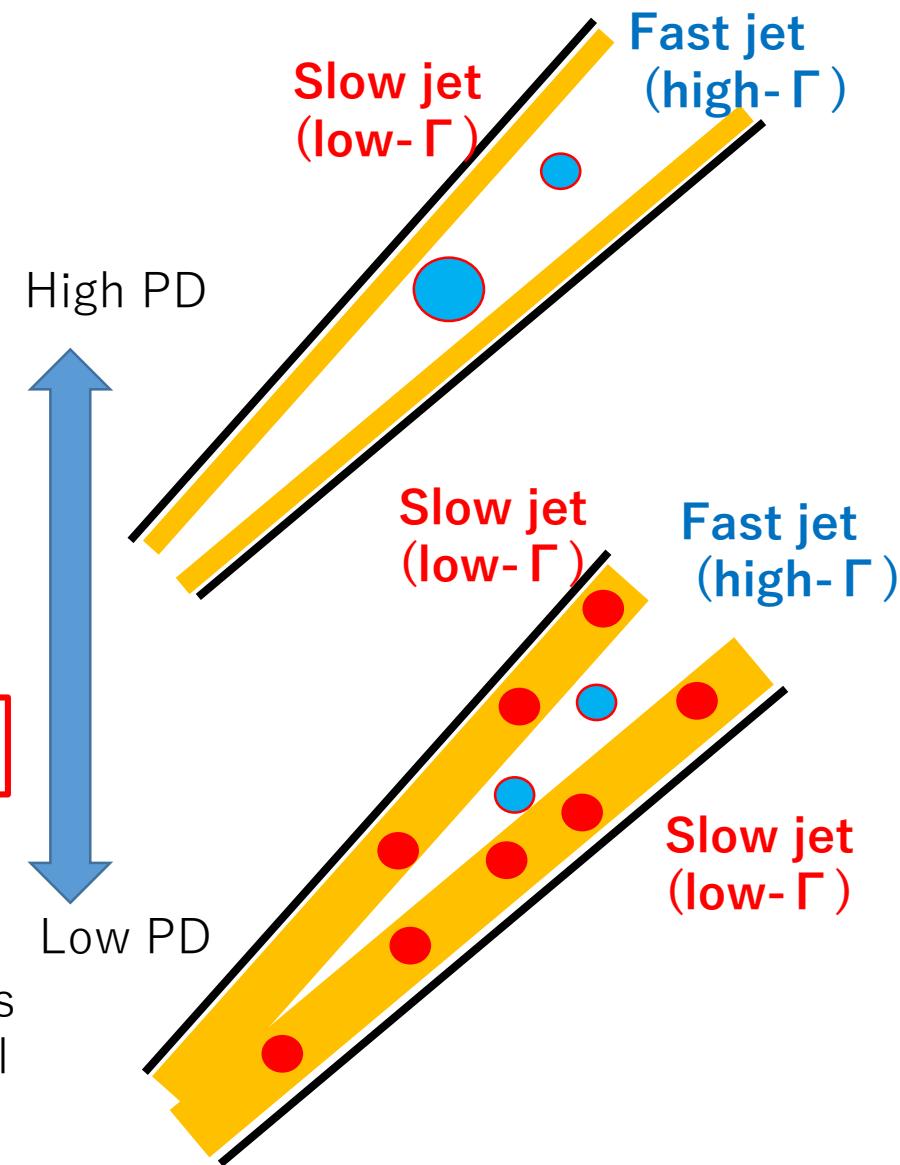

Spine-sheath model

+

Multi-Emission region model

**Spine: aligned magnetic field
sheath: chaotic magnetic field**

Superposition of several emission regions with various magnetic field directions will result in low degree of total polarization.

Summary for systematic study of blazar

- We performed long-term optical polarimetric observation of ~ 40 blazars with Kanata and *Fermi/LAT*.
- we found **Compton dominance might be good indicator** of polarization properties
- It imply a systematic difference in the intrinsic alignment of magnetic fields in pc-scale relativistic jets between different types blazars
- A measurement of “Flare cadence” will be helpful to test the assumption of “multi-emission region” model.
